

GSW-20 Control Unit

Connections are made as per wiring diagram overleaf.

If in doubt have a qualified electrician make all wiring connections.

If the controller is to be fitted to an older machine without the external relay, drill two holes (M3) between the spring housings.

Please ensure that the probe is in good working order before installing control unit.

The Microseal control units GSW-20M are supplied without the front fascia plate as the Microseal has the plate fixed to the machine. The unit is therefore TESTED but NOT Calibrated to the fascia scale.
